SDMX-JSON: SYNTAX AND DOCUMENTATION

2

3

SDMX Working Draft, 3 January 2014

4 **Status of this Document**

5 *This section describes the status of this document at the time of its publication. Other*
6 *documents may supersede this document.*

7 This is a Last Call Public Working Draft of SDMX-JSON format (SDMX-JSON) 1.0. It
8 is made available for review by the SDMX user community and the public.

9 The Last Call review period for this document extends until XX XX 2014. Please send
10 your comments to the SDMX Technical Working Group (SDMX-TWG) xxxx@xxx.xx.
11 Each email message should contain only one comment.

12 Publication as a Working Draft does not imply endorsement by the SDMX Sponsors.
13 This is a draft document and may be updated, replaced or obsoleted by other documents
14 at any time.

15 This document has been produced by the SDMX-TWG. The authors of this document
16 are the members of the SDMX-TWG. Different parts of this specification have different
17 editors.

1 Introduction

Let's first start with a brief introduction of the SDMX information model.

In order to make sense of some statistical data, we need to know the concepts associated with them. For example, on its own the figure 1.2953 is pretty meaningless, but if we know that this is an exchange rate for the US dollar against the euro on 23 November 2006, it starts making more sense.

There are two types of concepts: dimensions and attributes. Dimensions, when combined, allow to uniquely identify statistical data. Attributes on the other hand do not help identifying statistical data, but they add useful information (like the unit of measure or the number of decimals). Dimensions and attributes are known as "components".

The measurement of some phenomenon (e.g. the figure 1.2953 mentioned above) is known as an "observation" in SDMX. Observations are grouped together into a "data set". However, there can also be an intermediate grouping. For example, all exchange rates for the US dollar against the euro can be measured on a daily basis and these measures can then be grouped together, in a so-called "time series". Similarly, you can group a collection of observations made at the same point in time, in a "cross-section" (for example, the values of the US dollar, the Japanese yen and the Swiss franc against the euro at a particular date). Of course, these intermediate groupings are entirely optional and you may simply decide to have a flat list of observations in your data set.

The SDMX information model is much richer than this limited introduction, however the above should be sufficient to understand the sdmx-json format. For additional information, please refer to the [SDMX documentation](#).

Samples, tools and other SDMX-JSON resources are available in the public Github repository <https://github.com/sdmx-twg/sdmx-prototype-json/tree/master/draft-sdmx-json>.

Before we start, let's clarify a few more things about this guide:

- New fields may be introduced in later versions. Therefore consuming applications should tolerate the addition of new fields with ease.
- The ordering of fields in objects is undefined. The fields may appear in any order and consuming applications should not rely on any specific ordering. It is safe to consider a nulled field and the absence of a field as the same thing.
- Not all fields appear in all contexts. For example response with error messages may not contain fields for data, dimensions and attributes.

113 2 Field Guide to SDMX-JSON Objects

114 2.1 Message

115 Message is the top level object and it contains the data as well as the metadata needed
116 to interpret those data. Example:

```
117 {  
118   "header": {  
119     # header fields #  
120   },  
121   "structure": {  
122     # structure objects #  
123   },  
124   "dataSets": [  
125     # data set objects #  
126   ],  
127   "errors": [  
128     # Error messages #  
129   ]  
130 }
```

131 2.1.1 header

132 *Object nullable.* *Header* contains basic technical information about the message, such as
133 when it was prepared and how has sent it. Example:

```
134 "header": {  
135   "id": "b1804c51-1ee3-45a9-bb75-795cd4e06489",  
136   "prepared": "2012-05-04T03:30:00"  
137 }
```

138 2.1.2 structure

139 *Object nullable.* *Structure* contains the information needed to interpret the data available
140 in the message, such as the list of concepts used. Example:

```

141 "structure": {
142     "uri": "http://sdw-ws.ecb.europa.eu/dataflow/ECB/EXR/1.0",
143     "dimensions": {
144         # dimensions object #
145     },
146     "attributes": {
147         # attributes object #
148     }
149     "annotations": [
150         # annotation objects #
151     ]
152 }

```

153 2.1.3 dataSets

154 *Array nullable.* *DataSets* field is an array of *DataSet* objects. That's where the data (i.e.:
155 the observations) will be. Example:

```

156 "dataSets": [
157     {
158         "action": "Information",
159         "observations": {
160             # observation objects #
161         }
162     }
163 ]

```

164 In typical cases, the file will contain only one data set. However, in some cases, such as
165 when retrieving, from an SDMX 2.1 web service, what has changed in the data source
166 since in particular point in time, the web service might return more than one data set.

167 2.1.4 errors

168 *Array nullable.* RESTful web services indicates errors using the HTTP status codes. In
169 addition, whenever appropriate, the error messages can also be returned using this error
170 field. Error is an array of error messages. Example:

```

171 "errors": [
172     {
173         "code": 150,
174         "message": "Invalid number of dimensions in the key parameter"
175     }
176 ]

```

177 **2.1.4.1 code**

178 *number*. Provides a code number for the error message. Code numbers are defined in the
179 SDMX 2.1 Web Services Guidelines. Example:

```
180 "code": 130
```

181 **2.1.4.2 message**

182 *string*. Provides the error message. Example:

```
183 "message": "Response too large due to client request"
```

184 **2.2 header**

185 Header contains basic information about the message, such as when it was prepared and
186 who has sent it. Example:

```
187 "header": {  
188   "id": "b1804c51-1ee3-45a9-bb75-795cd4e06489",  
189   "prepared": "2013-01-03T12:54:12",  
190   "sender": {  
191     "id": "SDMX"  
192   }  
193 }
```

194 **2.2.1 id**

195 *String*. Unique string that identifies the message for further references. Example:

```
196 "id": "TEC00034"
```

197 **2.2.2 test**

198 *Boolean nullable*. Indicates whether the message is for test purposes or not. False for
199 normal messages. Example:

```
200 "test": false
```

201 2.2.3 prepared

202 *String*. A timestamp indicating when the message was prepared. Values must follow the
203 ISO 8601 syntax for combined dates and times, including time zone. Example:

```
204 "prepared": "2012-05-04T03:30:00Z"
```

205 2.2.4 sender

206 *Object*. Information about the party that is transmitting the message. Sender contains
207 the following fields:

- 208 • id - *String*. A unique identifier of the party.
- 209 • name - *String nullable*. A human-readable name of the sender.
- 210 • contact - *Array nullable*. A collection of contact details.

211 Example:

```
212 "sender": {  
213   "id": "ECB",  
214   "name": "European Central Bank"  
215   "contact": [  
216     # contact details #  
217   ]  
218 }
```

219 2.2.4.1 contact

220 *Array nullable*. Information on how the party can be contacted.

221 Each object in the collection may contain the following field: * name - *String*. The
222 contact's name. * department - *String nullable*. The organisational structure for the
223 contact. * role - *String nullable*. The responsibility of the contact. * telephone - *Array*
224 *nullable*. An array of telephone numbers for the contact. * fax - *Array nullable*. An array
225 of fax numbers for the contact person. * uri - *Array nullable*. An array of uris. Each uri
226 holds an information URL for the contact. * email - *Array nullable*. An array of email
227 addresses for the contact person.

228 Example:

```
229 "contact": [  
230   {  
231     "name": "Statistics hotline",  
232     "email": [ "statistics@xyz.org" ]  
233   }  
234 ]
```

235 2.2.5 receiver

236 *Object nullable.* Information about the party that is receiving the message. This can be
237 useful if the WS requires authentication. Receiver contains the same fields as sender (see
238 above):

239 Example:

```
240 "receiver": {  
241   "id": "SDMX"  
242 }
```

243 2.3 structure

244 *Object nullable.* Provides the structural metadata necessary to interpret the data contained
245 in the message. It tells you which are the components (dimensions and attributes) used
246 in the message and also describes to which level in the hierarchy (data set, series,
247 observations) these components are attached.

248 Example:

```
249 "structure": {  
250   "uri": "http://sdw-ws.ecb.europa.eu/dataflow/ECB/EXR/1.0",  
251   "dimensions": {  
252     # dimensions object #  
253   },  
254   "attributes": {  
255     # attributes object #  
256   },  
257   "annotations": {  
258     # annotations object #  
259   }  
260 }
```

261 2.3.1 uri

262 *String nullable.* A link to an SDMX 2.1 web service resource where additional information
263 regarding the data flow is available. Example:

```
264 "uri": "http://sdw-ws.ecb.europa.eu/dataflow/ECB/EXR/1.0"
```

265 **2.3.2 name**

266 *String nullable.* Data flow name. Example:

```
267 "name": "Sample dataflow"
```

268 **2.3.3 description**

269 *String nullable.* Descriptio of the data flow. Example:

```
270 "description": "Data flow description."
```

271 **2.3.4 dimensions**

272 *Object.* Describes the dimensions used in the message as well as the levels in the hierarchy
273 (data set, series, observations) to which these dimensions are attached. Example:

```
274 "dimensions": {  
275     "dataSet": [  
276         # Component objects #  
277     ],  
278     "series": [  
279         # Component objects #  
280     ],  
281     "observation": [  
282         # Component object #  
283     ]  
284 }
```

285 **2.3.5 attributes**

286 *Object.* Describes the attributes used in the message as well as the levels in the hierarchy
287 (data set, series, observations) to which these attributes are attached. Example:

```
288 "attributes": {  
289     "dataSet": [  
290         # Component objects #  
291     ],  
292     "series": [  
293         # Component objects #  
294     ],
```

```

295     "observation": [
296         # Component objects #
297     ]
298 }

```

299 2.3.6 Component

300 A component represents a dimension or an attribute used in the message. It contains
301 basic information about the component (such as its name and id) as well as the list of
302 values used in the message for this particular component. Example:

```

303 {
304     "id": "FREQ",
305     "name": "Frequency",
306     "keyPosition": 0,
307     "values": [
308         {
309             # value object #
310         }
311     ]
312 }

```

313 Each of the components may contain the following fields

314 2.3.6.1 id

315 *String*. Identifier for the component. Example:

```

316 "id": "FREQ"

```

317 2.3.6.2 name

318 *String*. Name provides a human-readable name for the component. Example:

```

319 "name": "Frequency"

```

320 2.3.6.3 description

321 *String nullable*. Provides a description for the component. Example:

```

322 "description": "The time interval at which observations occur over a given time period."

```

323 2.3.6.4 keyPosition

324 *Number nullable*. Indicates the position of the dimension in the key, starting at 0. This
325 field should not be supplied for attributes. This field could be used to build the “key”
326 parameter string (i.e. D.USD.EUR.SP00.A) for data queries. Example:

```
327 "keyPosition": 0
```

328 2.3.6.5 role

329 *String nullable*. Defines the component role(s). For normal components the value is null.
330 Components can play various roles, such as, for example:

- 331 • **time**. Time dimension is a special dimension which designates the period in time
332 in which the data identified by the full series key applies.
- 333 • **measure**. Measure dimension is a special type of dimension which defines multiple
334 measures.

335 Example:

```
336 "role": "time"
```

337 2.3.6.6 default

338 *String or Number nullable*. Defines a default value for the component (valid for attributes
339 only!). If no value is provided in the data part of the message then this value applies.
340 Example:

```
341 "default": "A"
```

342 2.3.6.7 values

343 *Array*. Array of values for the component. Example:

```
344 "values": [  
345   {  
346     "id": "M",  
347     "name": "Monthly"  
348   }  
349 ]
```

350 **2.3.6.8 Component value**

351 *Object nullable.* A particular value for a component in a message. Example:

```
352 {  
353     "id": "M",  
354     "name": "Monthly"  
355 }
```

356 **2.3.6.8.1 id** *String.* Unique identifier for a value. Example:

```
357 "id": "A"
```

358 **2.3.6.8.2 name** *String.* Human-readable name for a value. Example:

```
359 "name": "Missing value; data cannot exist"
```

360 **2.3.6.8.3 description** *String nullable.* Description provides a human-readable description of the value. The description is typically longer than the text provided for the name field. Example:

```
363 "description": "Description for missing value."
```

364 **2.3.6.8.4 start and end fields** *String nullable.* Start and end are instances of time that define the actual Gregorian calendar period covered by the values for the time dimension. The algorithm for computing start and end fields for any supported reporting period is defined in the SDMX Technical Notes.

368 These fields should be used only when the component value represents one of the values for the time dimension.

370 Values are considered as inclusive both for the start field and the end field. Values must follow the ISO 8601 syntax for combined dates and times, including time zone.

372 Example:

```
373 {  
374     "id": "2010",  
375     "name": "2010",  
376     "start": "2010-01-01T00:00Z",  
377     "end": "2010-12-31T23:59:59Z"  
378 }
```

379 These fields are useful for visualisation tools, when selecting the appropriate point in
380 time for the time axis. Statistical data, can be collected, for example, at the beginning,
381 the middle or the end of the period, or can represent the average of observations through
382 the period. Based on this information and using the start and end fields, it is easy to get
383 or calculate the desired point in time to be used for the time axis.

384 2.3.7 Annotations

385 *Array nullable*. Provides a list of annotation objects. Annotations can be attached to
386 data sets, series and observations.

```
387 "annotations": [  
388   {  
389     "title": "Sample annotation",  
390     "uri": "http://sample.org/annotations/74747"  
391   }  
392 ]
```

393 Each annotation object contains the following optional information:

394 2.3.7.1 title

395 *string nullable*. Provides a title for the annotation. Example:

```
396 "title": "Sample annotation"
```

397 2.3.7.2 type

398 *string nullable*. Type is used to distinguish between annotations designed to support
399 various uses. The types are not enumerated, as these can be specified by the user
400 or creator of the annotations. The definitions and use of annotation types should be
401 documented by their creator. Example:

```
402 "type": "reference"
```

403 2.3.7.3 uri

404 *string nullable*. URI - typically a URL - which points to an external resource which may
405 contain or supplement the annotation. If a specific behavior is desired, an annotation
406 type should be defined which specifies the use of this field more exactly.

```
407 "uri": "http://sample.org/annotations/74747"
```

408 **2.3.7.4 text**

409 *string nullable*. Contains the text of the annotation.

```
410 "text": "Sample annotation text"
```

411 **2.3.7.5 id**

412 *string nullable*. ID provides a non-standard identification of an annotation. It can be
413 used to disambiguate annotations. Example:

```
414 "id": "74747"
```

415 **2.4 dataSets**

416 An array of data set objects. Example:

```
417 "dataSets": [  
418   {  
419     "action": "Information",  
420     "series": {  
421       # series object #  
422     }  
423   }  
424 ]
```

425 There are between 2 and 3 levels in a data set object, depending on the way the data in
426 the message is organized.

427 A data set may contain a flat list of observations. In this scenario, we have 2 levels in
428 the data part of the message: the data set level and the observation level.

429 A data set may also organize observations in logical groups called series. These groups
430 can represent time series or cross-sections. In this scenario, we have 3 levels in the data
431 part of the message: the data set level, the series level and the observation level.

432 Dimensions and attributes may be attached to any of these 3 levels.

433 In case the data set is a flat list of observations, observations will be found directly
434 under a data set object. In case the data set represents time series or cross sections, the
435 observations will be found under the series elements.

436 **2.4.1 action**

437 *String nullable.* Action provides a list of actions, describing the intention of the data
438 transmission from the sender's side. **Default value is Information**

- 439 • Append - this is an incremental update for an existing data set or the provision
440 of new data or documentation (attribute values) formerly absent. If any of the
441 supplied data or metadata are already present, it will not replace these data.
- 442 • Replace - data are to be replaced, and may also include additional data to be
443 appended.
- 444 • Delete - data are to be deleted.
- 445 • Information- data are being exchanged for informational purposes only, and not
446 meant to update a system.

447 Example:

448 "action": "Information"

449 **2.4.2 reportingBegin**

450 *String nullable.* The start of the time period covered by the message. Example:

451 "reportingBegin": "2012-05-04"

452 **2.4.3 reportingEnd**

453 *String nullable.* The end of the time period covered by the message. Example:

454 "reportingEnd": "2012-06-01"

455 **2.4.4 validFrom**

456 *String nullable.* The validFrom indicates the inclusive start time indicating the validity
457 of the information in the data.

458 "validFrom": "2012-01-01T10:00:00Z"

459 **2.4.5 validTo**

460 *String nullable.* The validTo indicates the inclusive end time indicating the validity of
461 the information in the data.

462 "validTo": "2013-01-01T10:00:00Z"

463 **2.4.6 publicationYear**

464 *String nullable.* The publicationYear holds the ISO 8601 four-digit year.

```
465 "publicationYear": "2005"
```

466 **2.4.7 publicationPeriod**

467 *String nullable.* The publicationPeriod specifies the period of publication of the data in
468 terms of whatever provisioning agreements might be in force (i.e., “2005-Q1” if that is
469 the time of publication for a data set published on a quarterly basis).

```
470 "publicationPeriod": "2005-Q1"
```

471 **2.4.8 annotations**

472 *Array nullable.* An optional array of annotation indices for the dataset. Indices refer
473 back to the array of annotations in the structure field. Example:

```
474 "annotations": [ 3, 42 ]
```

475 **2.4.9 attributes**

476 *Array nullable.* Collection of **attributes values** attached to the data set level. This is
477 typically the case when a particular attribute always has the same value for the data
478 available in the data message. In order to avoid repetition, that value can simply be
479 attached at the data set level. Example:

```
480 "attributes": [ 0, null, 0 ]
```

481 **2.4.10 observations**

482 *Object nullable.* Collection of **observations** directly attached to a data set. This is the
483 case when a data set represents a flat collection of observations. In case the observations
484 are organised into logical groups (time series or cross-sections), use the **series element**
485 instead. Example:

```
486 "observations": {  
487   "0:1:0": [ 105.6, 0, 1 ],  
488   "0:1:1": [ 105,9 ]  
489 }
```

490 2.4.11 series

491 *Object nullable.* A collection of series. Each series object contains the observation values
492 and associated attributes, when the observations contained in the data set are used into
493 logical groups (time series or cross-sections). This element must **not** be used in case the
494 data set represents a flat list of observations. Example:

```
495 {  
496   "annotations": [],  
497   "attributes": [ 0, 1 ],  
498   "observations": {  
499     "0": [ 105.6, null, null ],  
500     "1": [ 105.9 ],  
501     "2": [ 106.9 ],  
502     "3": [ 107.3, 0 ]  
503   }  
504 }
```

505 2.4.11.1 annotations

506 *Array nullable.* An optional array of annotation indices for the series. Indices refer back
507 to the array of annotations in the structure field. Example:

```
508 "annotations": [ 3, 42 ]
```

509 2.4.11.2 attributes

510 *Array nullable.* Collection of attributes values. Each value is an index to the *values* array
511 in the respective *Attribute* object. Example:

```
512 "attributes": [ 0, 1 ]
```

513 For information on how to handle the attribute values, see the section dedicated to
514 handling component values.

515 2.4.11.3 observations

516 *Object nullable.* An object of observation values. Each observation value is an array of
517 one of more values.

```
518 "observations": {  
519   "0": [ 105.6, null, null ],  
520   "1": [ 105.9 ],  
521   "2": [ 106.9 ],  
522   "3": [ 107.3, 0 ]  
523 }
```

524 The keys in the observation object are the index values of the observation level dimensions.
525 It's one for time series and cross-sections, but there will be more than one when the data
526 set represents a flat list of observations.

527 The first value in the observation array is the observation value. The data type for
528 observation value is *Number*. Data type for a reported missing observation value is a *null*.

529 Elements after the observation value are values for the observation level attributes.

3 Handling component values

531 Let's say that the following message needs to be processed:

```
{
  "header": {
    "id": "62b5f19d-f1c9-495d-8446-a3661ed24753",

                "start": "2013-01-21T00:00:00Z",
                "end": "2013-01-21T23:59:59Z"
            }
        ]
    },
    ],
    "attributes": {
        "dataSet": [],
        "series": [
            {
                "id": "TITLE",
                "name": "Series title",
                "values": [
                    {
                        "name": "New zealand dollar (NZD)"
                    }, {
                        "name": "Russian rouble (RUB)"
                    }
                ]
            }
        ]
    },
    ],
    "observation": [
        {
            "id": "OBS_STATUS",
            "name": "Observation status",
            "values": [
                {
                    "id": "A",
                    "name": "Normal value"
                }
            ]
        }
    ]
},

```

```

    "dataSets": [
      {
        "action": "Information",
        "series": {
          "0": {
            "attributes": [0],
            "observations": {
              "0": [1.5931, 0],
              "1": [1.5925, 0]
            }
          },
          "1": {
            "attributes": [1],
            "observations": {
              "0": [40.3426, 0],
              "1": [40.3000, 0]
            }
          }
        }
      }
    ]
  }
}

```

532 There is one data set in the message, and it contains two series.

```

"0": {
  "attributes": [0],
  "observations": {
    "0": [1.5931, 0],
    "1": [1.5925, 0]
  }
},
"1": {
  "attributes": [1],
  "observations": {
    "0": [40.3426, 0],
    "1": [40.3000, 0]
  }
}

```

533 The structure.dimensions field tells us that, out of the 6 dimensions, 4 have the same
 534 value for the 2 series and are therefore attached to the data set level.

535 We see that, for the first series, we get the value 0:

536 "0": { ... }

537 From the structure information, we know that CURRENCY is the series dimension.

```
"series": [  
  {  
    "id": "CURRENCY",  
    "name": "Currency",  
    "keyPosition": 1,  
    "values": [  
      {  
        "id": "NZD",  
        "name": "New Zealand dollar"  
      }, {  
        "id": "RUB",  
        "name": "Russian rouble"  
      }  
    ]  
  }  
]
```

538 The value 0 identified previously is the index of the item in the collection of values for
539 this component. In this case, the dimension value is therefore “New Zealand dollar”.

540 The same logic applies when mapping attributes.

541 **4 Security Considerations**

542 This document defines a response format for SDMX RESTful Web Services in JSON
543 format and it raises no new security considerations. SDXM Web Services Guidelines
544 includes the security considerations associated with its usage.
